

Thematic maps with mapsf :: CHEAT SHEET

Base map

```
library(mapsf)
# import the sample dataset
mtq <- mf_get_mtg()
# display a base map
mf_map(mtg, col = "orange", border = "white")
# display symbology
mf_map(mtg, var = "POP", type = "prop",
       leg_title = "Population", add = TRUE)
# map layout
mf_layout(title = "Martinique",
          credits = "Source:IGN, 2018")
```

Colors

mapsf can use color palettes from `hcl.colors()`
`mf_get_pal()` is useful to create well-balanced asymmetric diverging palettes
`mf_get_pal(n = c(7, 2), pal = c("Burg", "Mint"))`

Symbology

x should be an `sf` object of polygons, lines, or points.

Legends

Default legends are plotted with each map.

One can use `mf_legend()` or the `maplegend` package for more customization options.

Map layout

Customization of the layout design

- ① Set a map theme
`mf_theme(background = "#aad3df", mar = c(0, 0, 0, 0))`
- ② Create a shadow effect
`mf_shadow(...)`
- ③ Create a map inset
`mf_inset_on(mtg)`
`mf_map(mtg)`
`mf_inset_off()`
Use `mf_inset_on(x = "worldmap")` and `mf_worldmap()` to display a globe
- ④ Display a title
`mf_title(...)`

- ⑤ Display labels
`mf_label(...)`
- ⑥ Display an annotation
`mf_annotation(...)`
- ⑦ North arrow
`mf_arrow(...)`
- ⑧ Scale bar
`mf_scale(...)`
- ⑨ Credits
`mf_credits(...)`

Export maps

`mf_export()` exports maps in PNG and SVG formats.
The width/height ratio of the exported figure will match the one of a spatial object.
`mf_export(mtg, width = 3, filename = "map.svg")`
`mf_map(mtg, add = TRUE)`
`dev.off()`

Class intervals

`mf_get_breaks()` uses `classInt` and additional methods (e.g., "Q6", "geom", "arith", "msd" or "ckmeans") to classify continuous variables.

width : 3 in.
(inferred) height : 3.5 in.
